# Validating the use of autorating technologies in the assessment of speaking skills

**Trevor Breakspear** 

Jan Langeslag, William Bayliss, Johnathan Cruise, Frank Wucinski

Al is not a he or a she or even an it, Al is more like a "they." Rob Smith, CEO of Pecabu

> By far, the greatest danger of Artificial Intelligence is to conclude too early that we understand it. Eliezer Yudkowsky, AI Researcher

East Asia Assessment Solutions Team We know already that machine learning has huge potential, but data sets with biases will produce biased results - garbage in, garbage out. Sarah Jeong, Journalist specializing in IT law

#### Where we want to be

"..the transdisciplinary space at the intersection of language processing technologies and second language assessment." (Chapelle & Chung, 2010)

#### Where I am in Data Science!

Fit for purpose: align the technical potential and best practice test development; minimize the limitations

6

Inferential validity argument based on supporting assumptions (decisions made) at key stages of the test development process (Kane, 1992)

• What are the difference between human and autorated assumptions and implications?

![](_page_5_Figure_4.jpeg)

![](_page_6_Picture_0.jpeg)

7

#### Assessment tool overview

# IELTS Smart Learning (ISL) owned by the IELTS Partners

- Low-stakes AI rated speaking solution for Chinese students aged 12-16, CEFR level A1-B2.
- Placement test includes constrained and openended response tasks
- Placement test is holistically rated and provides recommended product level to start practice.
- Scoring rubrics and item specifications based on CEFR
- Formative content includes activities over 12 product levels with AI enabled scores and feedback.

![](_page_6_Figure_8.jpeg)

![](_page_6_Figure_9.jpeg)

![](_page_7_Picture_0.jpeg)

#### Autorater training overview

![](_page_7_Figure_2.jpeg)

- ✓ Consistent group of 6 gold-standard raters trained engine over 6-month period on a 0-6 scale (A1-B2+)
- $\checkmark$  Each candidate response scored by between 3 and 6 raters
- Statistical modelling techniques, regular training and weekly rater feedback improve training data reliability

![](_page_8_Picture_0.jpeg)

![](_page_8_Figure_2.jpeg)

![](_page_9_Picture_0.jpeg)

#### Human rating/Machine rating correlation

![](_page_9_Figure_3.jpeg)

Commonly expressed as a correlation between machine and human ratings (where 0 = no correlation, and 1 = 100% correlation)

![](_page_10_Picture_0.jpeg)

![](_page_10_Figure_2.jpeg)

![](_page_11_Picture_0.jpeg)

![](_page_11_Figure_2.jpeg)

How generalizable is the scoring model to the general test taker population?

![](_page_12_Picture_0.jpeg)

## Original proficiency distribution

![](_page_12_Figure_2.jpeg)

![](_page_13_Picture_0.jpeg)

![](_page_13_Figure_2.jpeg)

![](_page_14_Picture_0.jpeg)

#### Enhancing sample distribution

![](_page_14_Figure_2.jpeg)

16

![](_page_15_Picture_1.jpeg)

### Human-machine correlation (4)

![](_page_15_Figure_3.jpeg)

| Training 4                                     |                |
|--|----------------|
| RHO Correlation Coefficient                    | .93**          |
| **. Correlation is significant at the 0.01 lev | el (2-tailed). |

![](_page_16_Picture_0.jpeg)

1. Are human ratings targeting the speaking features required?

2. Do machine predictors equate to features used by humans?

3. Consequences of construct underrepresentation (gaming/unconventional responses)

Iterative development = iterative validation

![](_page_16_Figure_6.jpeg)

![](_page_17_Picture_0.jpeg)

#### In-development validation

1. Are human ratings targeting the speaking features required? Discourse analysis

2. Do machine predictors equate to features used by humans? Larger representative data sample to train – work needed

 3. Consequences of construct underrepresentation (gaming/unconventional responses)
 Outlier analysis/extraction filters – more work needed

Iterative development = iterative validation

![](_page_17_Figure_6.jpeg)

![](_page_17_Figure_7.jpeg)

![](_page_18_Picture_0.jpeg)

## Word level pronunciation validation: Purpose and Approach

- To consider the efficacy of pronunciation scores delivered by an AI engine at the word level
- To provide meaningful feedback to tech partner on weaknesses of the current AI feedback system
- To facilitate improvement in the quality of AI-driven pronunciation feedback to learners

![](_page_18_Figure_6.jpeg)

#### Developing the word-level rating scale

- Development based on three rating scale principles (1) clear (2) concise and (3) discrete
- Scale based on the pronunciation features (1) phoneme accuracy

| Descriptor   | Score |
|--|-------|
| The word was produced as commonly pronounced in recognized global English variants.  | 5     |
| The word was produced as commonly pronounced in any recognized global English variant, minor issues with syllable delivery | 4     |
| Lapses in phonetic accuracy may be noticeable  | 3     |
| Phoneme delivery may be faulty   | 2     |
| Mispronounced phoneme, or intrusive substitution or deletion of a phoneme  | 1     |

![](_page_24_Picture_0.jpeg)

![](_page_24_Picture_1.jpeg)

#### Developing the word-level rating scale

- Development based on three rating scale principles (1) clear (2) concise and (3) discrete
- Scale based on the pronunciation features (1) phoneme accuracy (2) word stress

| Descriptor  | Score |
|---|-------|
| The word was produced as commonly pronounced in recognized global English variants. Appropriate number of syllables and stress was placed on the correct syllable.  | 5     |
| The word was produced as commonly pronounced in any recognized global English variant. Appropriate number of syllables and stress placed on the correct syllable. There may be minor issues with syllable or stress delivery. | 4     |
| Lapses in phonetic accuracy and/or word stress  | 3     |
| Phoneme delivery and/or stress may both be faulty   | 2     |
| mispronounced phoneme, or intrusive substitution or deletion of a phoneme and stress may be faulty.   | 1     |

![](_page_25_Picture_0.jpeg)

![](_page_25_Picture_1.jpeg)

### Developing the word-level rating scale

- Development based on three rating scale principles (1) clear (2) concise and (3) discrete
- Scale based on the pronunciation features (1) phoneme accuracy (2) word stress accuracy and (3) effect on intelligibility
- Results of rater perception survey showed examiners considered descriptors clear and easy to use (4.33/5)

| Descriptor  | Score |
|---|-------|
| The word was produced as commonly pronounced in recognized global English variants. Appropriate number of syllables and stress was placed on the correct syllable.  | 5     |
| The word was produced as commonly pronounced in any recognized global English variant. Appropriate number of syllables and stress placed on the correct syllable. There may be minor issues with syllable or stress delivery. | 4     |
| The word as produced is intelligible. Lapses in phonetic accuracy and/or word stress may be noticeable but cause little strain.   | 3     |
| The word as produced is barely intelligible. Phoneme delivery and/or stress may both be faulty causing some strain and possible misunderstanding.   | 2     |
| The word produced may include a mispronounced phoneme, or intrusive substitution or deletion of a phoneme and stress may be faulty. Resulting in misunderstanding or the pronunciation of a different word.                   | 1     |

## Identifying Outliers: Word Level

- The human and machine ratings per word were ranked from highest to lowest and the correlation calculated.
- Word groups with a negative correlation between human and machine ratings were collated and sent to the tech partner for further investigation.

| Word        | Syllables | Sample<br>(no. of recordings) | Correlation | Rank Av diff |
|-------------|-----------|-------------------------------|-------------|--------------|
| Literature  | 4.00      | 13                            | -0.170      | 98           |
| Talented    | 3.00      | 7                             | -0.086      | 76           |
| Reduces     | 3.00      | 6                             | -0.619      | 111          |
| Novel       | 2.00      | 4                             | -0.146      | 77           |
| Page-turner | 3.00      | 4                             | -0.830      | 104          |
| Character   | 3.00      | 3                             | -0.932      | 210          |

| Word        | Comments   | Performance      | Rater<br>Fair Average | Machine<br>Score | Error<br>Filter | Feedback<br>Error |
|-------------|--|------------------|-----------------------|------------------|-----------------|-------------------|
| visit       | Machine score significantly lower than human average. A review suggests a native speaker controlling stress and phonemes correct as per UK RP. Machine underrating native/near native performance.   | Work<br>required | 4.55                  | 3.19             | Phoneme         | False<br>negative |
| character   | Machine score significantly higher than human average. A review shows that the second syllable is incorrectly stressed which could explain the overrating. This finding is supported by the Machine syllable stress error filter result. Conclusion: need to incorporate error filter into the overall pron score. | Work<br>required | 3.40                  | 4.96             | Stress          | False<br>positive |
| easy-going  | Machine score significantly higher than human average. A review shows word stress is poorly managed. This finding is supported by the Machine syllable stress error filter result. Conclusion: need to incorporate error filter into the overall pron score.   | Work<br>required | 3.40                  | 4.98             | Stress          | False<br>positive |
| page-turner | Machine scores significantly lower than human average. A review suggests a native speaker controlling stress and phonemes correct as per UK RP. Machine underrating native/near native performance.  | Work<br>required | 4.74                  | 3.64             | Phoneme         | False<br>negative |
| fiction     | Machine scores significantly lower than human average. A review suggests a native speaker controlling stress and phonemes correct as per UK RP. Machine underrating native/near native performance.  | Work<br>required | 4.83                  | 3.80             | Phoneme         | False<br>negative |
| character   | Machine score significantly higher than human average. A review shows that the second syllable is incorrectly stressed which could explain the overrating. This finding is supported by the Machine syllable stress error filter result. Conclusion: need to incorporate error filter into the overall pron score. | Work<br>required | 3.82                  | 4.98             | Stress          | False<br>positive |

![](_page_38_Picture_0.jpeg)

![](_page_38_Picture_1.jpeg)

### **Recommendations and modifications**

#### **Recommendations (test developers):**

- Check the engine performance of the following outlier words:
  - (a) Literature (b) Talented (c) Reduces
  - (d) Novel (e) Page-turner (f) Character
- 2. Check engine performance in relation to standard UK variant performance
- 3. Incorporate the error filter (phoneme/word stress) into the overall scoring model

#### Modifications (tech partner):

- Dictionary entries for the outlier word list reviewed, corrected phoneme error in entry "literature"
- 2. Upgraded dictionary entries to ensure UK English variant was included
- Error detection filter was combined with the overall scoring mechanism. Penalty score was deducted from the overall score for each phoneme/stress error made

![](_page_39_Picture_0.jpeg)

![](_page_39_Figure_1.jpeg)

#### **Next Steps**

- 1. Test the new combined model with a wider range of vocabulary items and learner samples
- 2. Validate penalty mechanism and work required/highlights categories
- 3. Extend study to include longer utterances and broader construct of pronunciation (liaison, intonation, sentence stress)
- 4. Conduct a more targeted validation study aligning human and machine pronunciation features and scales (comparing like-with-like)

![](_page_40_Picture_0.jpeg)

#### What's under the bonnet?
